Преподаватель: Е. С. Миронов

Москва, 2025

Условие

Родительский процесс создает два дочерних процесса. Первой строкой пользователь в консоль родительского процесса вводит имя файла, которое будет использовано для открытия File с таким именем на запись для child1. Аналогично для второй строки и процесса child2. Родительский и дочерний процесс должны быть представлены разными программами. Родительский процесс принимает от пользователя строки произвольной длины и пересылает их в pipe1 или в pipe2 в зависимости от правила фильтрации. Процесс child1 и child2 производят работу над строками. Процессы пишут результаты своей работы в стандартный вывод.

Цель работы

Изучение механизмов создания процессов, организации межпроцессного взаимодействия через pipes и обработки данных в многопроцессной архитектуре.

Задание

Правило фильтрации: нечетные строки отправляются в pipe1, четные в pipe2. Дочерние процессы инвертируют строки.

Вариант

21

Метод решения

Данная программа реализует многопроцессную обработку текстовых данных с использованием каналов (pipes) для межпроцессного взаимодействия. Основной алгоритм: родительский процесс читает строки из стандартного ввода и направляет нечетные строки первому дочернему процессу, четные - второму. Каждый дочерний процесс получает строки из своего канала, реверсирует их и записывает в указанный файл.

Ключевые компоненты:
ParentProcess - управляет каналами и дочерними процессами
Pipe - кросс-платформенная реализация каналов
ChildProcess - запускает дочерние процессы
ChildProcessor - обрабатывает данные в дочерних процессах

Системные вызовы:
Windows: CreatePipe, CreateProcess, ReadFile, WriteFile
Linux: pipe, fork, execl, read, write

Программа использует объектно-ориентированный подход с инкапсуляцией платформозависимых особенностей, что обеспечивает кроссплатформенность и четкое разделение ответственности между модулями.

Описание программы

Программа реализует многопроцессную обработку текстовых данных через каналы (pipes). Родительский процесс читает строки из стандартного ввода и распределяет их между двумя дочерними процессами: нечетные строки отправляются первому процессу, четные - второму.
Каждый дочерний процесс переворачивает полученные строки задом наперед и записывает результат в указанный файл.

Архитектура программы включает несколько модулей.
В main.cpp находится точка входа, создающая ParentProcess.
Класс ParentProcess (process.cpp) управляет всей работой: создает каналы, запрашивает имена файлов, запускает дочерние процессы и распределяет данные.
Класс Pipe (pipe.cpp) инкапсулирует работу с каналами, используя CreatePipe на Windows и pipe на Linux. Класс ChildProcess (childProcess.cpp/hpp) отвечает за запуск дочерних процессов через CreateProcess (Windows) или fork/execl (Linux).
ChildProcessor (childProcessor.cpp/hpp) обрабатывает данные в дочерних процессах: читает из канала, переворачивает строки и записывает в файл.

Результаты

Разработанная программа успешно реализует многопроцессную архитектуру для параллельной обработки текстовых данных.
В ходе решения были достигнуты следующие ключевые результаты:
Корректная работа системы межпроцессного взаимодействия
Реализованы два независимых канала передачи данных между родительским и дочерними процессами
Обеспечено четкое распределение строк по принципу четности/нечетности
Достигнута синхронизация процессов через блокирующие операции чтения/записи
Кросс-платформенная функциональность
Программа корректно работает как в Windows, так и в Linux/Unix системах
Реализована унифицированная абстракция для работы с каналами через класс Pipe
Обеспечен единый интерфейс для создания процессов на разных платформах

Выводы

В ходе лабораторной работы успешно разработана многопроцессная система обработки текстовых данных с использованием межпроцессного взаимодействия через каналы. Программа демонстрирует корректную работу в кросс-платформенном режиме на Windows и Unix системах.

Исходная программа

```
#include "process.hpp"

int main() {
    ParentProcess parent;
    parent.start();
    return 0;
}
```

Листинг 1: main.cpp - точка входа, создает ParentProcess

```
